

A QUESTION WORTH SITTING WITH

Aviation has a black box.
So do trains, ships,
power grids, even *hospitals*.

AIR

RAIL

SEA

POWER

CARE

YOUR PC

Your computer has nothing.

THE PATTERN

Every high stakes field learned the same lesson.

When something goes wrong, you cannot rely on memory, or on trust, or on whoever was in the room.

You need a record of what actually happened. One that survives the event, and cannot be quietly rewritten.

THE GAP

Now think about the computer.

It holds your money, your work, your private life, the systems a whole company runs on.

Yet when something goes wrong on it, we are left to guess. We reconstruct. We assume. We rarely *know*.

THE BLIND SPOT

We locked every door but the one in the room.

NETWORK THREATS, WATCHED

THE HAND ON THE MACHINE, UNSEEN

We have gotten good at stopping threats that come over the network. But the moment a person has the machine in their hands, that whole defense goes quiet.

THE PART NOBODY GUARDS

The most dangerous person rarely breaks in.

They are handed the keys.

The new hire. The contractor. The technician. Legitimate access, doing something it should not, looking exactly like normal work.

WHY IT GOES UNSEEN

Antivirus looks for malware.

It was never built to notice a person. It cannot tell the difference between routine work and a quiet betrayal, because both use a valid login.

The tools we trust are watching the wrong door.

+

SO WE BUILT ONE

The black box, for the *computer*.

When a device leaves your control, it records what happens in a form that cannot be quietly altered. If something goes wrong, the truth is still there.

WHAT IT ACTUALLY IS

Not prevention. *Evidence.*

A black box does not stop the incident. It makes the truth recoverable afterward.

It does not promise nothing will go wrong. It promises that if it does, you will know exactly what happened, and you will be able to prove it.

WHAT WE BELIEVE

Security has always
meant prevention.

We think it also means *accountability*.

| *Trust is good. Proof is better.*

OVER TO YOU

One honest question.

Every other critical system gets a flight recorder. Should the devices we run our work and our lives on be any different?

If you work in security, I would genuinely like to hear where you land on this. The disagreement is the interesting part.

Sathvik R

BUILDING BLACK BOX AT ALCYONE SECURE

Security is not just prevention. Security is accountability.
